

Product Internship Assignment: Improve D1 Retention

Context

Unrot (<https://unrot.co>) helps working professionals learn about AI through short lessons, news, and interview preparation.

The Challenge

Assume you are driving a product for Unrot. Your goal is to improve our D1 retention. For this exercise, D1 retention is the percentage of new users who return on the calendar day after their first session.

Currently, this number stands at 16%. The industry standard is 22%.

Propose what you would do to bridge this gap and why. Your solution must be executable and ready for evaluation within a four week timeline.

Resources and Constraints

You have access to existing product analytics and a squad consisting of:

- 1 Product Designer
- 2 Engineers
- 4 weeks of development time

Deliverables

Present your understanding of the problem, your assumptions, your recommended solution, how you would prioritize the work, and your validation approach. You can use any format that communicates your thinking clearly, including user flows, wireframes, research, or data analysis.

Please submit:

1. A working prototype of your solution.
2. A short slide deck explaining the problem, your solution, and your roadmap prioritization.

How We Evaluate

We will assess your submission based on:

- Problem framing and reasoning
- Product judgment
- Prioritization and feasibility
- Measurement approach
- Clarity of communication
